Where have you searched so far?

USP DWPI EPO JPO (ACM IBM TDB)

IEEE INSPEC SPI Other _____

Is this a "Fast & Focused" Search Request? (Circle One) (YES) NO

A "Fast & Focused" Search is completed in 2-3 hours (maximum). The search must be on a very specific topic and meet certain criteria. The criteria are posted in EIC3600 and on the EIC3600 NPL Web Page at http://ptoweb/patents/stic/stic-tc3600.htm.

What is the topic, novelty, motivation, utility, or other specific details defining the desired focus of this search? Please include the concepts, synonyms, keywords, acronyms, definitions, strategies, and anything else that helps to describe the topic. Please attach a copy of the abstract, background, brief summary, pertinent claims and any citations of relevant art you have found.

Please seal (New) A clam 31. PARTICULARLY when a Lead Time/schedule dithing date is dynamically updated in a catalog by an outside source, or scheduling system

29.   (Previously Presented) The method in claim 26, wherein the timing of when said push signal is sent to said catalog is dependent only upon said quantities in said capacity buckets.

30.   (Previously Presented) The method in claim 26, wherein said catalog comprises an online catalog connected to said capacity scheduling system via a network.

31.   (Previously Presented) A method of pushing changes in product shipment dates to a catalog comprising:

sending an original availability date for products to said catalog;

maintaining a capacity scheduling system that utilizes a series of capacity buckets to represent said product shipment dates, wherein each capacity bucket represents an additional shipment delay period and wherein said maintaining includes decreasing quantities in said capacity buckets as orders for said products are places; and

sending a push signal to said catalog when a capacity bucket of a product reaches a specified level;

wherein said push signal includes a revised availability date for said product in said catalog;

wherein said revised availability date is different than said original availability date by said shipment delay period;

wherein the timing of when said push signal is sent to said catalog is dependent only upon

Voluntary Results Feedback Form

➢ *I am an examiner in Workgroup:* [＿＿＿] *Example: 3620 (optional)*

➢ *Relevant prior art **found**, search results used as follows:*

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
  (journal articles, conference proceedings, new product announcements etc.)

➢ *Relevant prior art **not found**:*

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

ABSTRACT: In manufacturing, the term scheduling is used to describe a
variety of business processes, including dispatching, expediting, machine
and labor allocation, and capacity planning. Unfortunately, attempts to
implement a scheduling process often end in failure. Today's competitive
manufacturing environment, however, makes the cost-effective use of
resources a must, and a successful scheduling process can be a major
contributor to this effort. A successful scheduling process implementation
must be defined based on the goals and limitations of an organization.
Experience in scheduling implementation successes - and failures - has led
to the development of a methodology that is globally applicable, yet yields
a unique solution for the manufacturer. Basic steps of the methodology
are: 1. team building, 2. definition of performance metrics, 3.
selection of a generalized approach, 4. design of required reports, 5.
determination of data sources, 6. analysis and refinement of specific
approaches, 7. selection of the implementation method, and 8. deployment.

TEXT: The term "scheduling" is used in manufacturing to describe a variety
of business processes, including dispatching, expediting, machine and labor
allocation, and capacity planning. Unfortunately, attempts to implement a
scheduling process often end in failure. Today's competitive manufacturing
environment, however, makes the costeffective use of resources a must, and
a successful scheduling process can be a major contributor to this effort.

For most organizations, the first attempt to implement a scheduling process
begins with a search for the appropriate software. But failure to
successfully implement scheduling software usually isn't the software's
fault. Instead, there are two common reasons scheduling implementation
fails: selection of the wrong software, or incorrect implementation of the
software or both. A successful scheduling process is the result of upfront
planning and analysis that will lead to successful implementation and
software selection.

Though many of the challenges facing manufacturing today are pervasive, the
solutions to these problems are typically unique to an organization. Long
lead times, unacceptable levels of work-in-process inventories, failure to
meet due dates, high overtime costs, and other hindrances to profitability
can be found in any manufacturing facility. Overcoming these challenges
usually requires a unique and creative solution appropriate for a
particular organization. Manufacturing facilities often classify functions
within the facility to enable more generalized solution approaches, but
implementation of these approaches can only be successful if the correct
definition of the required outcomes is performed before the solution

approach is selected.

A successful scheduling process implementation must be defined based on the goals and limitations of an organization. Experience in scheduling implementation successes--and failures--has led to the development of a methodology that is globally applicable, yet yields a unique solution for the manufacturer. Basic steps of the methodology are:
 * Team building;

 * Definition of performance metrics;

 * Selection of a generalized approach;

 * Design of required reports;

 * Determination of data sources;

 * Analysis and refinement of specific approaches;

 * Selection of the implementation method; and

 * Deployment.

Using this methodology requires significant initial planning and effort, but in most cases the lead time required for a full implementation is shortened because the process is thoroughly "debugged" off line before it is introduced to the plant floor. Some of the commonly held false ideas, as well as several elements of successful implementation of the steps, are discussed throughout the rest of this article.
Team building

A scheduling process affects and is dependent upon many areas of a manufacturing organization. Everyone from the sales department to the shop floor may have some interaction with a scheduling process, and their expertise is a necessity for successful implementation. A comprehensive scheduling process team will have members from systems or computer support, management, manufacturing engineering, purchasing, sales and order processing, and the shop floor. Each member of the team contributes knowledge from their area. They also provide input to the scheduling processes design. Systems expertise is essential to provide information about data sources and networking capabilities. Management input is needed to help determine goals and performance criteria. Manufacturing engineering provides knowledge about machine capabilities, part routings, etc. Purchasing is involved to provide information about material ordering lead times and availability. Sales and order processing represents the voice of the customer, and contributes information about acceptable lead times, promise dates, and demand information. Involvement from the shop floor is critical. A shop floor supervisor makes the final decision regarding whether to follow a schedule or ignore it--for all but the fully automated system. If shop floor personnel have no input into the scheduling process design, and don't have a reasonable understanding of the mechanics of the process, they are liable to view a schedule with skepticism and in some cases will circumvent or disregard the schedule entirely.

Definition of performance metrics

Defining performance metrics allows the team to answer a question: How do we tell a good schedule from a bad schedule? Manufacturers should expect some improvement in total system performance, (profitability, throughput, etc.) from implementation of a scheduling process. Additionally, a manufacturer's expectations should be defined and measurable. Typical

first-pass requirements for a scheduling process range from "need to know if we can get the work done on time" to "minimize total manufacturing costs." Scheduling team members who try to refine these requirements will run into tough questions, such as, how do we measure the cost of delivering one day late to the customer? Job shop-type operations such as tool and die facilities or prototype shops will often be more due-date driven, and end up with requirements that include "minimize maximum lateness," or "no late orders." Batch facilities more frequently build to stock, and will have other requirements. "Minimize total cost of inventory and setups" and "maximize throughput of bottleneck operations" are some typical examples of those types of requirements. Batch facilities that build components for assembly typically require "minimize inventory costs without allowing a shortage to occur." In any case, "feasibility" as a performance criteria may be acceptable for a first scheduling implementation. Once the scheduling process is in place, the structure will be available for a continuous improvement effort, and methods will be in place to identify additional opportunities to improve profitability.

In addition to definition of the performance metrics, the team must also define requirements for the scheduling system itself. Questions that must be answered in this step include:

* What is an acceptable scheduling lead time?

 * What type of planning horizon will we use?

 * Do we expect long-term capacity planning, as well as daily dispatch lists?

 * What annual budget is available to maintain the scheduling process?

 * Are we a candidate for an optimization technique, or will we perform "what ifs" each time we need to build a schedule?
* How much manual data entry is acceptable?

When facing these questions, remember this guiding principle: there is no need to plan in any greater detail than your ability to react to a problem. If process cycle times are in terms of hours, then a daily schedule is usually appropriate and schedule generation time should be less than an hour. If a schedule disruption occurs--a machine breaking down in the middle of the day--schedule regeneration may not be feasible or necessary. If the disruption continues to the next day, the next schedule generation should accommodate the expected duration of the machine breakdown.

Selection of a generalized approach

Generalized approaches include optimization, simulationbased systems, **capacity** " **buckets** ," network methods, and others. Within these generalized techniques, job sequencing methods, resource allocation rules, .and mathematical and heuristic algorithms are available, and will have varying impacts upon the performance criteria selected. For example, sequencing jobs by earliest due date can help minimize some measure of lateness, but it may have an adverse effect upon machine utilization. Highly constrained systems, such as job shops with material availability problems, will generally not be candidates for optimization. A flow or batch processing shop that focuses on throughput will present a better opportunity to improve their performance metric with a mathematical optimization technique. The main task for the team in this step is to narrow down the list of available choices and select some likely candidates for investigation. Further investigation of secondary constraints, including tooling availability, material handling equipment, and storage

space, may need to be considered. In any case, the secondary constraints should be listed as "potential" constraints until detailed analysis is completed.

Design of required reports

Designing necessary reports should be completed before a detailed implementation method is chosen. Before a scheduling software package is selected, the necessary reports should be designed in detail. Many of the software packages available allow for customized report development, however, it is important to assure that all data required for generation of custom reports is made available to the scheduling system. For example, auxiliary customer information is frequently needed in dispatch lists. The lists may include preferred shippers, credit status, and contact information. Operational reports include work-to and dispatch lists, while performance reporting includes order status, machine utilization, tool requirements lists, and others. The team may opt to review current reports and compare them with an "ideal" solution. Gantt charts, planning boards, and other types of output are frequently helpful in decision making. Reports should be designed with a specific audience in mind. The scheduler, shop floor personnel, and managers all need different types of information for decision making, and it is preferable to design many smaller reports to meet the needs of various audiences.

Summary reporting may also be designed, and this is typically used to evaluate the performance of the scheduling process. For example, a weekly report of scheduled vs. actual will allow team members to periodically review whether the scheduling process is being used effectively. There can be many reasons why a schedule is not followed. The most common of these is inaccuracy of the planning rates or poor timing estimates. Job shops are usually required to estimate processing times for each job, and summary reporting provides a feedback mechanism for improving these estimates.

Determination of data sources

Any scheduling process has extensive data requirements. Information requirements can be classified into two categories: frequently updated and infrequently updated. Frequently updated information includes all information necessary to generate a schedule, and is required each **time** a schedule is generated. Infrequently **updated** information includes basic resource and part information such as machine quantities, part routings, planning rates (cycle times), and secondary constraint information. The infrequently updated information usually only needs to be modified when there is a change to the manufacturing system, such as the purchase of new equipment, or a change to the scheduling system, which might include an improved resource allocation algorithm. Information required to generate a schedule includes orders, shop floor status, material status, and available work hours. Most modern organizations have order entry and inventory tracking systems in place. Some have shop floor tracking systems as well. Determination of these data sources frequently requires some interpretation of the available data. Other order entry systems contain information such as "order quantity," "open order quantity," "required order quantity," and "fulfillment quantity." But which one is the appropriate planning quantity? Will the scheduling system be required to update the planning quantity based on shop floor status and inventory information, or will the order entry system be updated appropriately? This step will require the team member to develop a "data map," which describes how the data will logically be interpreted in the scheduling system. It also defines how data will be made available physically to the scheduling system.
Analysis and refinement of specific approaches

At this step in the process, the charge of the scheduling process team will be to determine exactly how the manufacturing system will be scheduled in order to meet the performance criteria. To accomplish this task, various methodologies need to be tested, not on the shop floor, but in a simulation model. A benchmark model of the current system can be developed as a starting point. One of the first results from this analysis should be the determination of the scope of the scheduling process. In other words, identify those resources that will require a high level of scheduling detail. These are the bottleneck processes--those that provide the greatest hindrance to throughput and profitability. At this point, the team may decide that only the bottleneck processes require any type of detailed scheduling, thereby reducing the problem size dramatically. The team can also identify those resources that require a low level of scheduling detail--those resources that have excess capacity.

The benchmark simulation model can also be used to test the integrity of the process logic, prove the input data sources, establish a benchmark level of the performance criteria, and identify expected level of performance improvement.
(Chart Omitted)

For organizations without a formal process planning or routing system, testing the integrity of the process logic is essential. The investigation process itself often helps the team move from "we've always done it this way," to examination of the actual physical constraints and determination of an improved method. For example, a stamping plant process engineer may declare, "we always like to run part B after part A." When asked if this was to minimize **change** over **time** , the response would most likely be, "no, it's just a preferred practice." In reality, the A, B sequence did minimize **change** over **time** , but the process engineer must be made aware that this policy alone will have a tendency to drive up inventories.

Establishing a benchmark level of the performance criteria and identification of an expected improvement may be an important step to the scheduling team. Scheduling implementations can range in cost from $5,000 to $300,000, and this step will provide the team with the necessary information for cost justifying the implementation. If the team can prove increased throughput, reduced inventory or overtime costs, or other improvements utilizing a simulated model of the system under the new scheduling methodology, they will have less trouble justifying and gaining support for a scheduling process.
The simulation model provides a method for the team to test and fine tune scheduling rules or algorithms. Typically, they will be able to select and implement a set of sequencing rules, resource allocation rules, constraint considerations, and optimization algorithms in the model to evaluate the impact upon the performance metrics. There is a seemingly infinite set of methods available for queuing jobs and assigning resources, and the task of the team will be to either select the "best" method to use on an on-going basis or to reduce the set to a manageable size where "what-ifs" can be performed each time a schedule is to be generated.

The simulation model should also be used by the team to test the scheduling processes under uncertain conditions. This is primarily an evaluation of the time estimates and the planning rates, are they adequate when minor downtimes are incurred? If major disturbances or downtimes are encountered, the scheduling process does not need to "plan for failure," but instead, a new schedule would be generated with the updated shop floor status.

Selection of the implementation method

Before this step is performed, the team has determined exactly what they

want a scheduling process to do, including how and when the schedule will be generated, where the information will come from, and what the report will look like. Armed with all this information, the team should find selection of implementation software a simple step. Many candidates can be eliminated at the outset, and the team must take care not to let persuasive software vendors suggest they revisit their decisions. The main consideration in this step is to determine how well a particular software package meets the design decisions that have already been made. Additional considerations include vendor reputation and support, cost, user features, available platforms, integration, and flexibility.

Deployment

The scheduling team may want to consider performing all steps of the implementation method for a prototype site within the organization. Scheduling is an integral part of any business, and expertise and ownership must be developed internally. Consultants may be used to help with the implementation process by providing experience and leadership, but eventually the team needs to build its own experiences and competency. Training in the scheduling process should convey the goals and performance metrics of the system and may be customized for different organizational levels. If a current working schedule system is in place, it may be necessary to run both systems concurrently for a short time. Resources must be allocated to assure a complete and robust deployment. The cost of the scheduling process implementation does not end with the purchase of the software. It is much better to read this here than to learn by experience.

A well developed, robust scheduling process provides an excellent framework for a continuous improvement effort. Capacity shortfalls become much easier to identify. If an organization has little experience with any of the techniques required for a robust implementation, it may be helpful to start with less than ambitious performance improvement requirements and a smaller scope. The scheduling process itself should remain under continuous scrutiny to identify improvement opportunities.

Elements of failure

Ignoring any of these issues is bound to slow down or even halt the effort toward a successful scheduling process:

* Too much detail;

 * No team involvement;

 * Poor communication;
 * Leaps of faith;

 * Selecting the software as the first step;

 * Ignoring data integration issues;

 * Excessive or unfriendly manual data entry;

 * Inflexibility;

 * No shop floor buy in;

 * No previous scheduling experience or expertise; and

 * Preconception that scheduling implementation is "easy."

Perhaps the most important of these issues is the level of detail. Many attempts at scheduling process implementation fail in the early stages due to efforts to allocate time and resources to every nut and bolt in a facility. The guiding principle here is to focus on the bottlenecks or greatest hindrances to profitability. Additional details can always be added if necessary, but the time and effort required to include the detail in the first place cannot be recovered.

Elements of success

* Team commitment;

* Up front planning and analysis;

* Determination of appropriate performance criteria;

* Driving the scheduling effort with the performance criteria;

* Attention to bottlenecks to determine the appropriate level of detail;

* Commitment of resources (including time) for robust implementation;

* Acquiring scheduling experience and expertise;

* Attention to capacity measurement techniques; and

* Good communication of concepts and goals.
If all of these issues are attended to, the successful scheduling process implementation will yield many benefits, including the optimal use of time as a resource. This will increase an organization's capacity, improve performance metrics, and enhance customer relationships. It will also result in better allocation of capital funding, as well as a much less stressful effort by the team members.

SIGNIFICANT ACTIVITIES

Write-up of meetings and training should provide an explanation that includes the " who, what, when, where and why" and as necessary, "how and/or how much".

-
-
-

DIFFICULTIES ENCOUNTERED/ACTION TAKEN

Each item in this section should include the " who, what, when, where and why." Always include the action taken to resolve the problem, even if the action is as simple as notifying the next level of authority.

- No significant difficulties were encountered during this reporting period.

ANTICIPATED ACTIVITIES

List or outline the major tasks planned for the next month. This can be a running list for those tasks you wish to accomplish as well as those mandatory or high priority tasks that must be completed by end of the month.

-
-
-

PERSONNEL ACTIONS

List hiring or termination information as well as extended vacations or absences.

- No personnel actions occurred during this reporting period.
